

COMMUNITY DAY

PUNE 2022 ---

Building application with analytical capabilities using AWS services and Apache Druid

Before we start...

How many of you heard of Druid

How many of you are tried Druid in the past

How many of you are using / planning to use druid in production

How many of you have the use case of providing analytics tool to your users as part of the product offerings

Again we are not starting ...

How many of you are application developers

How many of you are Data Scientist

How many of you are Data Engineers

Tijo Thomas

Lead Solutions Architect @ Imply

Dealing with Big Data Challenges since 2014

tijopthomas

- Story of building an analytical app
- Demo Wiring it up with AWS Services
- Demo on performance and concurrency
- How is Druid is best fit analytical apps
- Q&A

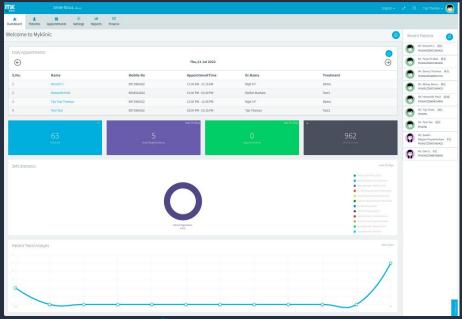

I want to build...

" In my application landing page, I want to show a real-time dashboard"

I want to build dashboard

Pain Areas

- This dashboard aggregate data over wide range of data points
- Dashboard refreshes frequent interval or when user navigate to landing page
- SaaS application with high concurrency
- Latency expectation is <200ms
- Realtime and historical data

I want to build...

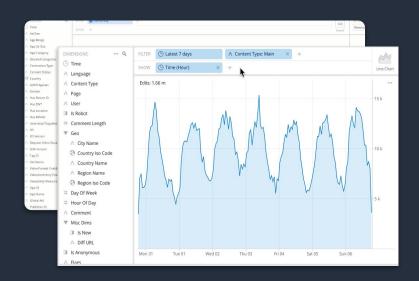

"Wish to provide a self service reporting capability to my customers"

This is what a modern analytics app looks like

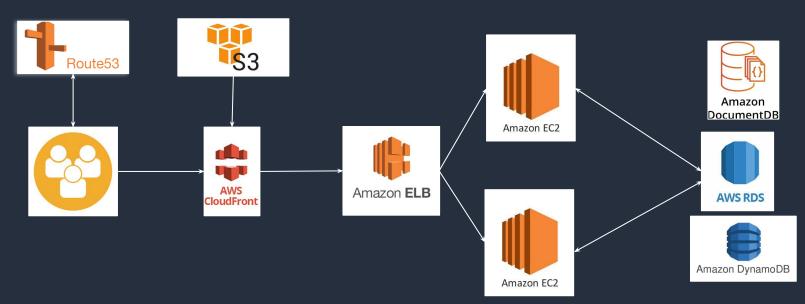

An interactive data experience with...

- TBs to PBs of data processed
- 100s to 1000s of queries per sec
- Real-time and historical data analyzed
- Most of the queries are groupby in nature
- Latency requirement < 200ms
- Highly concurrent query workload

Sample Architecture ...

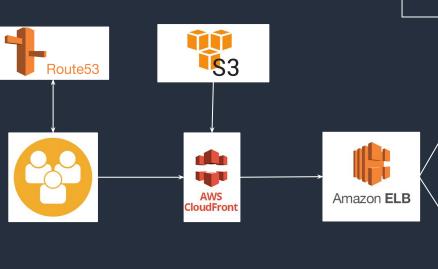

Sample Architecture ...

Amazon EC2

Challenges

- Data warehouses including column stores work only with batch ingestion and are not optimal for streaming data.
- DWs are a difficult to scale up and down based on the Query load.
- DWs support low concurrency. Concurrency comes with exponential cost
- DWs has limited support for indexing the data

Demo onboarding data

Demo how to query Druid

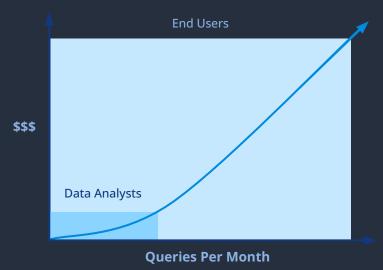

Demo the performance and concurrency

Unlimited Users: Modern analytics apps drive up concurrency

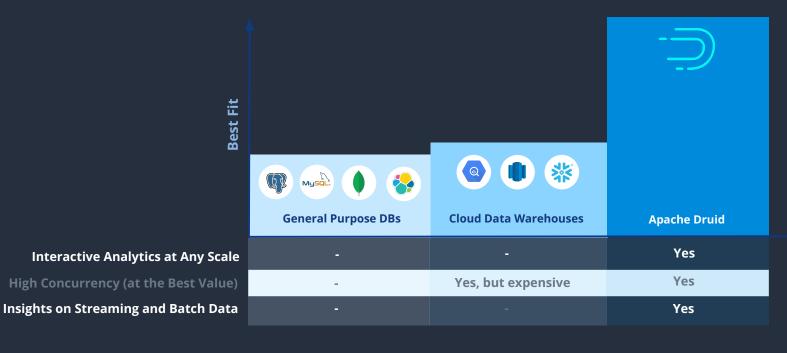

The cost for high concurrency increases exponentially with CDWs

A different database is needed for high concurrency at the best value

Druid shines for modern analytics applications

Recap the requirements

I want to build ...

- High concurrency analytical application
- Wanted to analyze real time and historical data together
- Need latency < 200ms for most of the usecase
- Wanted to scale up or down the infrastructure within reasonable time frame
 eg: <1 hr
- Many other secondary requirements

Secondary requirement

Reduce cost per query over older data with higher latency and lesser concurrency

Dont wanted to ingest all raw data but wanted to pre aggregate while ingesting to DB

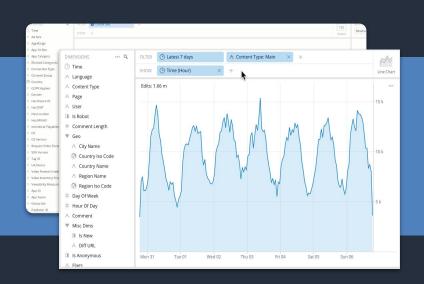

Let us see how druid helps here

What Is Druid?

Druid is the best database for modern analytics applications

10+

Years

400+

Contributors

1,000+

Customers deployed

11,000+

Community members

High performance.

low-latency, distributed query execution and high throughput ingestion

Real-time.

event data (clickstream, network flows, user behavior, programmatic advertising, server metrics, IoT...)

Analytics.

counting, ranking, statistics...

Database.

highly-available, time-sharded, partitioned, columnar, indexed, compressed, versioned materialized view

Commonly asked questions

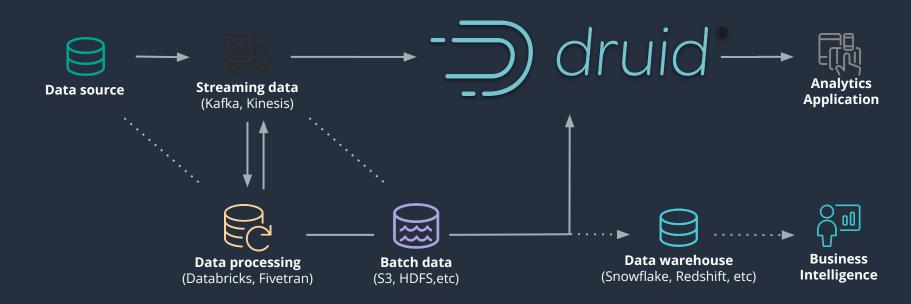

Druid a replacement for our existing Data warehouse?

Where does Druid fit in my big data stack?

Druid in the Data Ecosystem

Commonly asked questions

Is Druid a log aggregation search system

Commonly asked questions

Is Druid a in-memory database?

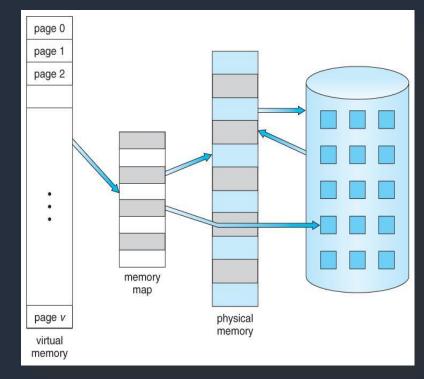

Is Druid a in-memory database?

Query Processing

- Segments can be memory mapped
- Not every time druid need to read from disk

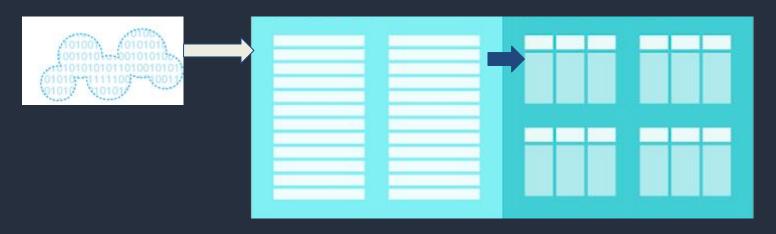

Is Druid a in-memory database?

- While ingesting data will be kept in memory and then written to disk
- The threshold for this is mentioned in the ingestion specification
